ISIMET – Warranty & Start-up Instructions

Each *ISMET* Product is supplied with an Operation & Maintenance Manual. In each manual is described a brief series of tests that should be performed for each component prior to placing the *ISMET* Control System into service. Additionally, certain installation compliance requirements are specified for components and these requirements must be met in order for the warranty of the product to be issued.

Perform all start-up tests, and after successful completion of these tests, complete the Warranty Start-up Checklist. Fill in all spaces and check mark all boxes that apply to the installation sign and date. We recommend that you also fill in the check-boxes in the manual and turn that copy over to the Owner's representative after placing the system into operation. Where a Serial Number is shown for a model number but the component installed was provided without this number, then leave the space blank.

Complete the Warranty Registration document. If a multiple of three (3) or more control systems are tested and placed into service at a single given time at a single specific project, then a Multi-System Registration form can be utilized. This document will stream line the process by allowing a single Start-up Checklist to be completed for all systems. When additional copies of specific pages of the Registration form are needed, copies may be made.

Copies of all documents required for the issuance of *ISMET* Warranty can be found in pdf format on the *ISMET* Installation CD and on our website.

Return copies of all Warranty and Start-up Checklists to *ISMET* via either US Mail or fax. Address and fax numbers are listed on the documents.
